## **Exercise 8a – Create storyboards to represent the user flow for a personal blog using Balsamiq**

### **AIM:**

The aim of this experiment is to construct storyboards that represent the user flow of a mobile application (e.g., a blog app) using the Balsamiq prototyping tool.

### **TOOLS USED:**

- **Balsamiq:** <https://balsamiq.com/>

### **CONCEPTUAL WORKFLOW:**

#### **1. User Flow Definition:**

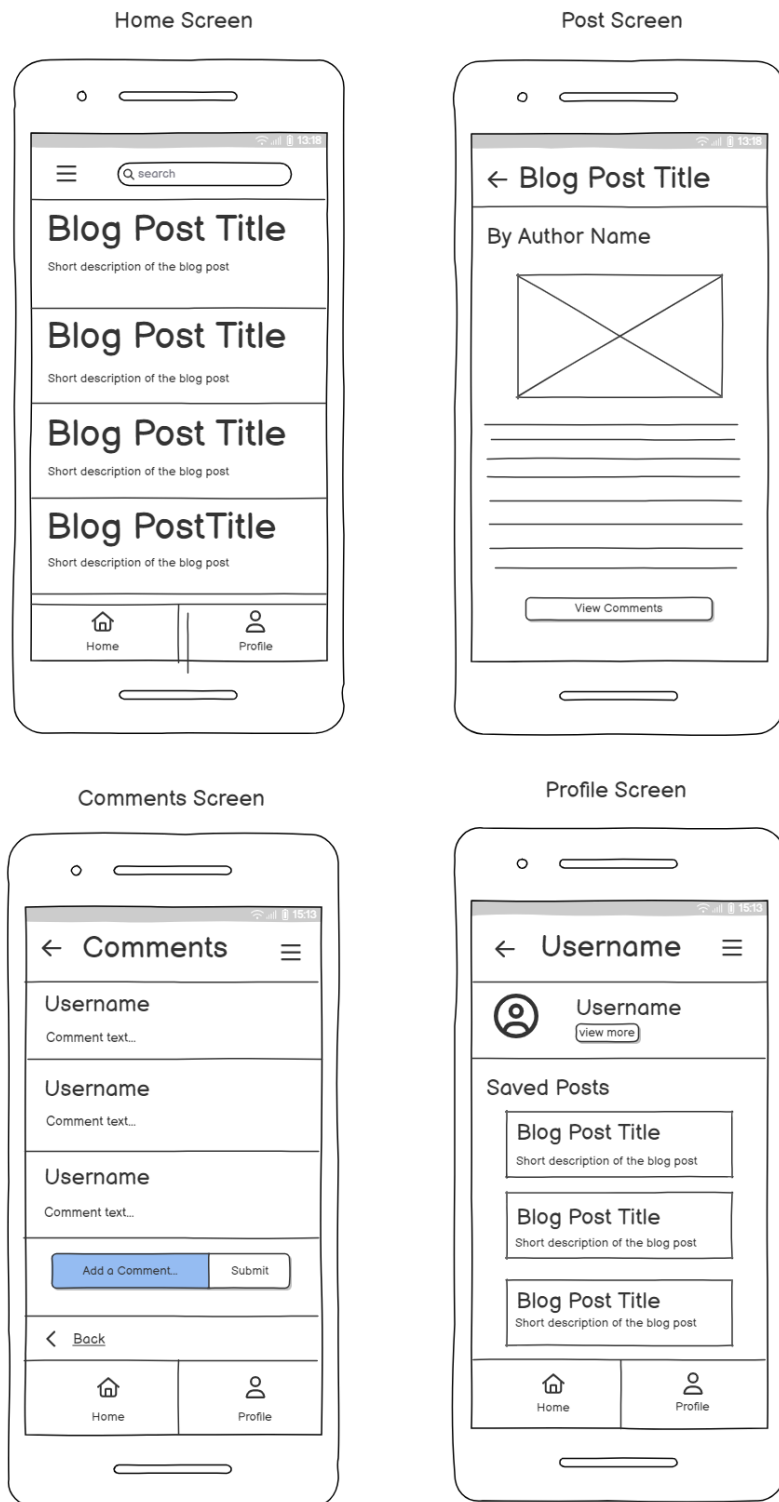

The process starts by identifying essential screens such as Home, Post, Comments, and Profile to facilitate a complete user experience. Mapping the user journey ensures that navigation between these screens is logical and intuitive for the intended user.

#### **2. Storyboard Construction:**

Wireframes are designed using Balsamiq components to define the specific layout of each screen, including headers, list items, and interactive navigation bars.

#### **3. Flow Organization:**

Screens are arranged to reflect the actual usage path: users start on the Home screen to browse posts, navigate to the Post screen for detailed reading, engage via the Comments screen, and manage their preferences through the Profile screen.

## RESULT:

The user flow for a blog application was successfully visualized through storyboards in Balsamiq. The design demonstrates a clear, functional path from content discovery to user interaction and profile management, validating the application's structural and navigational requirements.
